VIRGIL

PRESENTATION

Virgil provides a schematic view of your infrastructures to help you make the right decisions

With this application you can view the architecture of your network and remotely monitor your remote operation stations...

But above all you will be instantly informed of any network malfunctions and their impacts.

Energy transportation and distribution is becoming more complex and operating staff must be highly responsive.

So the possibility of knowing the repercussions of a problem in real time is a huge advantage. VIRGIL includes a library of objects and the representations of your network are performed using this library.

VIRGIL makes its data available via an RDBMS database to other applications such as: mapping, GIS etc.

In addition, the application can be updated at the same time as your infrastructures are developed.

VIRGIL / N PICTURES

Across one single interface, VIRGIL enables you:

- to query a device at any time
- to query a set of devices,
- to modify your measurement thresholds,
- to inhibit alarms,
- to print out customisable reports automatically or on demand
